

October 29, 2025

Jamie Ploetzner, PE (TX) Project Manager 13455 Noel Road Two Galleria Office Tower, Suite 700 Dallas, TX 75240

**ATTN:** Ms. Jamie Ploetzner

**RE:** Temporary / Construction Driveway Permit(s) # D1-2025-AR-0021

NM 136 @ MM 1.8+ in Dona Ana County.

#### STIPULATIONS FOR CONSTRUCTION OF DRIVEWAY ACCESS

Accept this letter of APPROVAL for purposes of retaining a temporary driveway permit only to be utilized for construction activity at NM 136 for Secondary Access. The applicant will be required to submit full set of certified construction drawings, to include all future traffic, drainage infrastructure, and permanent signing and striping. A detailed Traffic Impact Analysis shall be provided to the Department to address construction and post development impacts.

The Contractor Shall Submit the Traffic Control / Roadway Work Permit Application, Certified Traffic Control Plan, Certification of the Traffic Control Supervisor Implementing the TCP, Certificate of Liability Insurance with NMDOT as the Certificate Holder.

### THE APPLICANT UPON ACCEPTING THE APPROVED PERMIT WILL BE IN COMPLIANCE TO THE TERMS AND CONDITIONS OF THE NMDOT SPECIFICATIONS:

- (X) The applicant will be required to comply with all local Codes and Ordinances.
- (X) Repairs and maintenance of driveway from NMDOT right of way line to edge of pavement are the responsibility of the applicant and any future owners.
- (X) Adequate drainage within the right of way shall be maintained at all times.
- ( ) The driveway(s)/Auxiliary lane shall be finished within 45 days of start of construction within the highway ROW.
- (\_) Saw cut to inside of solid white line (shoulder stripe) of existing asphalt to include tapers for asphalt & concrete driveway pads, acceleration and deceleration lane, if applicable.
- (X) The contractor/applicant/developer SHALL treat all vertical drop-offs in accordance with the Departments Administrative Directive 241, Pavement Drop-Off Guidelines for Maintenance and Construction work Zones (AD 241 attached)
- ( ) Contractor SHALL provide a copy of approved Hot Mix Design Mix from a certified supplier to NMDOT District One Traffic Section at least two (2) weeks before starting paving operation per NMDOT Standards Specifications for Highway and Bridge 2019 edition.

#### Michelle Lujan Grisham

Governor

Ricky Serna Cabinet Secretary

#### **Commissioners**

#### **John McElroy** Commissioner District 1

#### Gary Tonjes Commissioner District 2

#### Hilma E. Chynoweth

Commission District 3

#### Walter G. Adams Commissioner District 4

### **Thomas C. Taylor**Commissioner District 5

### Charles Lundstrom Commissioner District 6

- ( ) Mailboxes installed within public right of way shall be constructed to United States postal Services or to NMDOT specifications.
- (X) Owner SHALL be required to construct and maintain GATE(s) or Cattle guard offset into your property and keep gate closed at all times to avoid any animals to get within NMDOT ROW.
- (X) Please note that the traffic control plan shall not be left overnight or unattended and will need to be removed at the end of the workday and placed down by the fence line.

A written request for a six (6) month extension is required before permit expires.

A copy of the approved driveway permit package and the approved traffic control plan that meets with MUTCD standards shall be on the job site while the driveway(s) are under construction.

NOTIFY THE DISTRICT ONE OFFICE 72 HOURS PRIOR TO CONSTRUCTION 575-640-0338 and the Anthony Maintenance Patrol Office @ 575-202-2127

Sincerely:

Andrew Guerra
Date: 2025.10.29 17:06:45

Digitally signed by Andrew

Andrew Guerra, PE, CFM District One Traffic Engineer

cc. David Madrid, Anthony Patrol Supervisor 41-51

#### **INSTRUCTIONS**

# Access Permit General System Usage

Please submit applications at least 40 days prior to scheduled work.

- Complete Application Details
  - Fill in all required fields in the application form.
  - Upload required documents as specified (e.g., plans, approvals, certifications).
- Review and Submit
  - Review your application for accuracy.
  - Click [Submit] to send your application for review.
- Check Application Status
  - Use the **Dashboard** section to monitor the status of your application.
- Respond to Requests (if applicable)
  - If additional information is requested, please update your application with any required documents or clarifications.
- Download Permit
  - Once approved, download your permit from the system.

#### **Need Help?**

- If you encounter any issues, you may submit a help ticket by clicking the **Support** link at the upper-right of your screen.
- For contact information and other resources, please refer to the NMDOT ePermitting website here: NMDOT ePermitting | NMDOT

#### **Documents Checklist**

### Following is a list of required documents, and other documents that may be required depending on the scope of the requested permit.

Document Name	Documents Required for Application	Other Documents
Agreement with Rail Owner		X
Archaeological & Environmental Clearances		Х
Certificate of Liability Insurance		x
Design Plans	x	
(Plan and Profile Sheets, Detail Drawings)		
Indemnification/Hold Harmless Agreement	X	
Proof of Property Ownership	X	
(Warranty deed/purchase agreement)		
Property Survey Map	x	
Rail Agreement with Contractor		x
Railroad Safety, Training, Insurance Flagger		X
Revegetation Plan	x	
Site Grading and Drainage Plan Approval		X
(Comply with Drainage Design Manual, 2018, Section 803)		
Site Layout (on a 11" x 17" sheet - 4 copies)	x	
Site Threshold Assessment Form	x	

(STA) - Less than 100 Peak Hour Trips		
Stormwater Pollution Prevention Plan	X	
Traffic Control Plan aka. barricading plan		X
(Plans may be obtained from local engineers)		
Traffic Impact Analysis		x
(TIA) 100 or More Peak Hour Trips		
Traffic Signal Agreement	X	
Vicinity Map	X	
Other		X

#### **ACKNOWLEDGMENT DETAILS**

The proposed driveway or median opening must be located, designed and constructed in accordance with 18.31.6 NMAC, State Highway Access Management Requirements. A Gate, Cattle Guard, Additional Fence, or Drainage Structure will be required which owner agrees to furnish and hereafter maintain in good repair and closed to livestock. The applicant shall submit a construction traffic control plan for approval. The owner will protect, indemnify, and hold the New Mexico Department of Transportation harmless from any injury or damage caused the owner, or third parties, by owner's failure to comply with the above. If this permit is granted, owner further agrees to comply with all condition, restrictions, and regulations of the New Mexico Department of Transportation. If not constructed, this permit will expire six (6) months from the date of issue unless otherwise noted and approved. The permittee shall notify the District Engineer or designee of the pending construction at least three (3) working days prior to any construction, and upon completion, which shall be within 45 days of initiation of construction. The permittee, his or her heirs, successors-in-interest, assigns, and occupants of the property serviced by the access shall be responsible for the repair and maintenance of the access beyond the edge of the roadway including any cattle guard and gate, and the removal of snow or ice upon the access even though deposited on the access in the course of the Department snow removal operations. Any work in state highway right-of-way must be approved in writing by the Department prior to initiating the work.

- I have met local government codes regarding the facility / structure being placed via this permit.
- I hereby declare that the information furnished above is true, complete, and correct to the best of my knowledge and belief. I understand that in the event of my information being found false or incorrect at any stage, my application shall be liable to cancellation.

that scope.

#### Site Threshold Analysis (STA)

According to NMAC 18.31.6.16, a traffic engineering evaluation shall be required for all land development proposals that may directly or indirectly impact a state highway facility. A Site Threshold Analysis (STA) is required of all developing or re-developing properties that directly or indirectly access a state roadway. The STA examines existing roadway volumes and anticipated site trip generation for the purpose of determining if additional analyses are required as defined by the District Traffic Engineer or designee. If the site characteristics and the trip generation estimate for a proposed development are greater than 100 trips in a peak hour, then requirements for a Traffic Impact Analysis (TIA) may be required as determined by the District Traffic Engineer or designee. See TIA outline for

The STA shall warrant one or all of the following conditions:

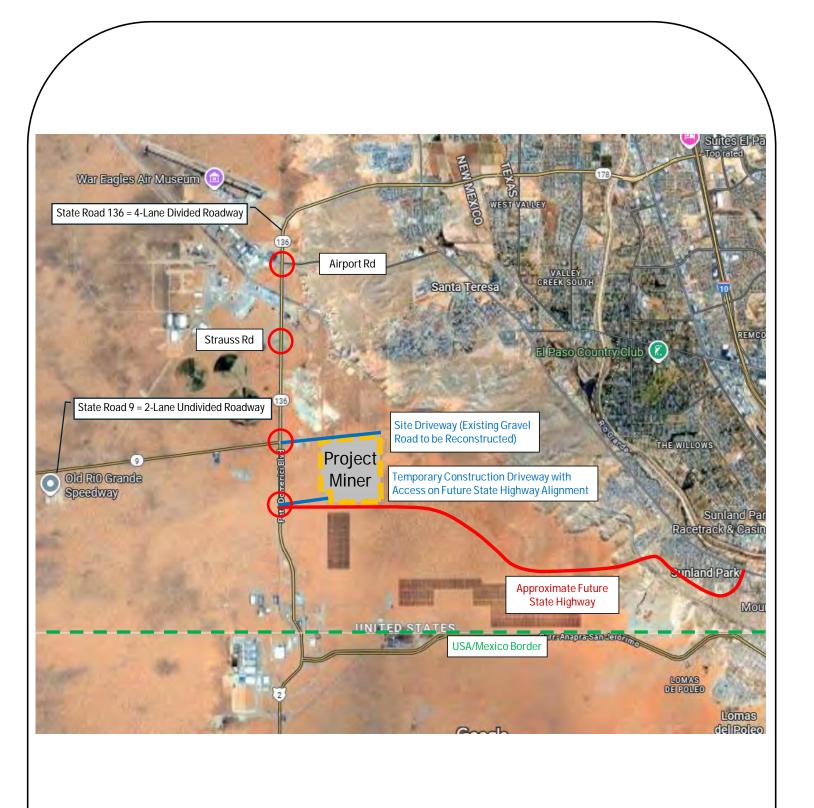

- May or may not warrant an additional traffic analysis.
- May or may not warrant off-site improvements.

analysis. See attached construction traffic demand estimates.

May require a TIA, which may or may not require off-site improvements.

If additional analysis is required based on the results of the STA, the District Traffic Engineer or designee, should indicate to the applicant the level of analysis that is required.

Data Center TIS | DRAFT 10/14/2025

CONFIDENTIAL (NOT FOR DISTRIBUTION)

### **Environmental Certification for Undertakings within NMDOT Rights-of-Way**

Please fill out the form completely. Submittals are reviewed in the order received. Allow 10-15 business days for the processing. Emergency requests are handled on a case-by-case basis.

Any tree removals needed for the commission of the utility work shall be reviewed and approved by the NMDOT Environmental Bureau as part of the permit. Provide latitude, longitude, tree type, and tree condition. Any trees on the NM Noxious Weed List are excluded from this requirement.

- 1. Purpose and Nature of undertaking. Describe the undertaking along with width, length and depth of ground disturbance. Include the methods and machinery to be used. Site access to construct a proposed data center project. Utilize an existing driveway header at SH 9/SH 136 intersection, and construct a driveway header on east side of SH 136 at the existing median opening which is future connection of Border Highway project.
- **2.** Is your project resulting from a NMDOT project? If so, provide the control and/or project number.

Ñο

**3. Funding source.** Is the funding private, state, or federal? If state and/or federal, list agency(s).

**Private** 

**4. Land status.** Is the project on right of way owned by BLM, Forest Service, Tribal land, or State Trust land? (NMDOT does not own all highway rights of way)

No - impacted ROWs owned by NMDOT

**5. Permitting agencies.** List other permitting agencies involved besides NMDOT.

**Dona Ana County** 

**6. County**. List the county or counties in which the project is located.

**Dona Ana County** 

**7. Highway number.** Indicate the highway the project will cross or parallel.

Offset east from SH 136 (does not front on SH 136); receives access from SH 136

**8. BOP and EOP.** Provide the milepost (MP) locations for the beginning of the project area (BOP) and the end of the project area (EOP). Indicate BOP and EOP on project area maps, as well. If highway crossing only, list the milepost location.

North driveway access is north of milepost 2, south driveway access is south of milepost 2

**9. Side(s)** of the road. Indicate on which side of the road the project will be located using cardinal directions (north, south, east, west). List all project crossings of the highway by milepost.

East

**10. Length** of the project. Indicate the length of the project within NMDOT right of way in terms of feet and/or miles.

North drive (existing street header) ~100 LF; South drive (proposed connection) ~200 LF

11. Provide the legal description of the project area: Township, Range, and

Section(s). A certain 412.694 ac parcel of land within sections 31 and 32, Township 28 South, Range 3 East, and sections 5 and 6, Township 29 South, Range 3 East New Mexico Principal Meridian Dona Ana County, New Mexico

**12. Maps / Locational Information.** Include a map or other location information such as Esri Shapefiles and/or a Google Earth image or kml/kmz file at an appropriate scale so that the project area within the NMDOT right-of-way can be accurate and precisely identified in the NMDOT GIS database. If milepost information is unavailable, please use latitude and longitude coordinates of the BOP and EOP.

KMZ included with application package

Re: Cultural Resources Pedestrian Survey

Verde Site Development – 789-acre Eastern Expansion

Santa Teresa, Dona Ana County, New Mexico

Dear Mr. Vaughan:

We thank you for the opportunity to present the enclosed Cultural Resources Pedestrian Survey report for the above referenced project site. We were authorized to proceed with this study on July 16, 2025 by Mr. Harvey Powers, representing BorderPlex Digital Assets, LLC. The information we are presenting herein describes the procedures utilized for field investigation and database review, along with the results of our assessment. It also includes our evaluation of the data obtained and conclusions regarding potential archaeological artifacts.

It was a pleasure to work with you on this phase of your project, and we look forward to assist you further on this and other future projects. If you have any questions regarding the information we present herein, please call us.

Respectfully submitted,

LOI ENGINEERS

#### **ABSTRACT**

LOI ENGINEERS (LOI) conducted a reconnaissance cultural resource pedestrian survey of a 789.00-acre tract of land located in Santa Teresa, Dona Ana County, New Mexico. The survey took place on July 23-25, 29, 2025. A review of a cultural resource desktop assessment was also performed.

Scattered and isolated potential El Paso Brown ceramics were found throughout the Area of Potential Effects (APE). However, there were little to no ceramics found in the northwest or center areas of the APE. Our findings were neither curated nor collected.

#### 1.0 INTRODUCTION AND PROJECT SUMMARY

BorderPlex Digital Assets, LLC contracted LOI Engineers (LOI) to conduct a cultural resource pedestrian survey of a site whose Area of Potential Effects (APE) totals  $\pm 789.00$  acres. The project area is located  $\pm 1.29$  miles east of Pete Domenici Boulevard and  $\pm 1.54$  miles north of the United States-Mexico border, in Santa Teresa, Dona Ana County, New Mexico.

The scope of this pedestrian survey includes a reconnaissance survey conducted by LOI. As this project is 100% privately funded, there is no requirement for compliance with Section 106 of the National Historic Preservation Act (NHPA) of 1996, as well as no coordination with the New Mexico Historic Preservation Division, which serves as the State Historic Preservation Office (SHPO).

#### 2.0 PROJECT INFORMATION

This survey is:	■ the initial survey for this project.
	☐ a continuation of previous survey(s):
	Previous investigation(s):
Report Completion Date:	08/26/2025
Date(s) of Survey:	07/23-25/2025, 07/29/2025, 08/19/2025
Archeological Survey Type:	□ Reconnaissance □ Intensive
Report Version:	☐ Draft ⊠ Final
Report Author(s) and Affiliation:	E. Isabel Olague, Cleo Cisneros, and John D. Cordova, P.E., of LOI Engineers.
Estimated Percentage of Time that the Principal Investigator was in the Field:	60%

#### 3.0 AREA OF POTENTIAL EFFECTS AND SURVEY AREA

#### Area of Potential Effects (APE):

The APE encompasses the entirety of the project are, which is approximately 789.00 acres of land in Santa Teresa, Dona Ana County, New Mexico. The APE encompasses the entirety of the project area, regardless of the extent of prior archeological investigations, the particular locations subject to field investigations, or the portion of a project added through a design change. If impacts are not known, worst-case impacts are assumed in defining the APE.

See Appendix A for a map of the APE.

#### No Survey Area:

Not applicable – the entire APE requires survey.

#### **Access Denied Area:**

There was no area requiring survey to which access was denied for this project.

#### Survey Area:

The survey area is the same as the APE.

#### 4.0 PROJECT SETTING

#### Natural Setting:

#### Topography:

There are no significant landforms at the project site. Uneven terrain encompasses the entirety of the site, with small sand dunes and arroyos of different sizes cutting across the site. There are clearings devoid of plant life that may have attracted past human activity due to the undisturbed space and surrounding sand dunes potentially serving as protective features. The northwest area of the APE consisted of crowded plant growth. No areas of actively flowing water were observed during the survey.

#### Geology:

According to the New Mexico Bureau of Mines and Mineral Resources geologic map (located in Appendix B-1.1), provided by United States Geological Survey (USGS), the APE is located in a Qcf, geologic zone (Seager et al., 1987). Part of the Rio Grande Rift, this zone is characterized by fluvial facies, most notably deposits from the Rio Grande, historically. This includes gray to yellow sand, pebble to cobble gravel, calcite-cemented sandstone and conglomerate, and gray, green, or red loam to clay with minor volcanicash lenses (Seager et al., 1987). There were no areas that geologically indicated past human activity at the surface or below the surface.

#### - Soils:

The U.S. Department of Agriculture's National Resource Conservation Service Web Soil Survey (WSS, 2025) was utilized to classify the soils within the APE, located in Appendix B-1.2. The soils are classified in the Pajarito-Pintura complex, with a 45-35 percent composition, respectively. The remaining 20 percent consists of minor components.

The parent material that makes up the Pajarito component is mixed coarse-loamy alluvium. It has very low runoff potential and drains water well. The soil is not considered a hydric soil.

The parent material that makes up the Pintura component is sandstone derived eolian sands. The runoff class is negligible and water is somewhat excessively drained. The soil is not considered a hydric soil.

The remaining soil components are Onite, Simona, Harrisburg, and Wink. All four profiles

Page 5

are not considered to be hydric soils.

This soil complex would not have allowed for significant pooling of water or provided a significant source of water.

Historic Land Use:

According to aerial photographs, the land has historically been used as undeveloped and vacant land. The land has not been used in a significant way. A historic abandoned railroad lies to the north of the APE, but it is currently an unpaved road.

Land Use:

The land is currently vacant and undeveloped, and is not in use. There is a semi-graded area of land at the northeast corner that cuts diagonally from the north side to the east side of the site. This strip of land is about 20 feet across and seems to be used as a path. The west side of the path is lined with partially intact barb-wired fencing with wood posts. There is no evidence of any other disturbance by previous construction, development, or other modern land use practices.

Vegetation:

Various species of desert shrubs, trees, and grasses were identified throughout the project site during the pedestrian survey, including creosote brush, tobosa grass, and soaptree yucca.

#### **Evaluation of Project Setting:**

Based on the undisturbed nature of the project setting, there is a likelihood of prehistoric or historic archaeological sites being present. If the area were to be left undisturbed, natural weather events may not be able to preserve such findings with sufficient integrity.

#### 5.0 **SURVEY METHODS**

#### Surveyors:

E. Isabel Olague, Cleo Cisneros, and John D. Cordova, P.E. of LOI Engineers surveyed the APE. Assistance was obtained from Andrea Rubio, Job Saucedo, Armando Trejo, Damian A. Uribe, John Findley, and Josh Salas of LOI ENGINEERS.

Page 6

#### **Description of Methods:**

A pedestrian inspection reconnaisance was conducted for the purposes of this survey. The APE was divided into vertical transects, approximately 25 meters apart, for efficiency and guidance for the surveyor(s). Each transect was walked from north to south, or south to north. If any visible artifacts were found while observing the ground and surrounding landscape, the location was staked, the coordinates were recorded using a Global Positioning System (GPS), and photos were taken of the artifact(s) found. No excavations were performed, nor shovel test pits or augers, or any other mechanical equipment used.

Other Methods:

None.

Collection and Curation: ☑ NO ☐ YES

No collection was conducted during the pedestrian survey.

#### Comments on Methods:

A reconnaisance survey was conducted to determine the archaeological potential of the APE. No collection of any findings was conducted unless a substantial artifact was found.

#### 6.0 SURVEY RESULTS

#### **Survey Area Description:**

The survey area is composed primarily of loamy sand and various desert shrubs. There is no evidence of past or current land grading, and no improvements have been made at the project site. Various animal tracks and birds were observed. Tire tracks presumably belonging to recreational sports vehicles were also acknowledged during the survey. Modern human artifacts were identified, including articles of clothing, backpacks, plastic and glass bottles, bullet casings, and other miscellaneous items.

Pedestrian Survey - Verde Site Development (789-acre expansion), in Santa Teresa, New Mexico LOI File No. J25-3-1990

August 26, 2025

Page 7

Reliable sources of water were not immediately observed within or around the APE. While many geological substances were identified, no sources of toolstone were observed during the reconnaissance. The APE is considered not to contain arable land due to the extreme lack of rainfall - water would need to be supplied through extensive irrigation systems.

Because of observations made during the survey, cultural artifacts found would not be preserved with good integrity. Modern human activity would likely compromise, and have compromised, the integrity of any sites (through the use of recreational vehicles and passage of humans). These areas would need to be restricted to the public and protective measures would need to be put in place, only if any findings were to be considered eligible for the National Register of Historic Places (NRHP), so that disturbances would be minimized.

#### Archaeological Materials Identified and Archaeological Site Description:

The potential cultural materials identified throughout the APE consisted of small, fragmented sherds that resembled El Paso Brown ceramics, but were not sufficient in quantity or size to determine the complete shape of any potential piece of ceramic pottery. There was no general location in which many were concentrated, however, no sherds were found in the northwest corner of the site, nor in a stretch of land spanning from the northeast corner toward the southwest corner. The sherds were encountered across the APE in two main forms: (1) artifact concentrations (clustered scatters) and (2) isolated finds, which represent single sherds lacking spatial association with other artifacts. For this survey, artifact concentrations are defined as clusters of artifacts occurring in close proximity (within 50 meters of the nearest finding), while isolated finds were recorded individually (more than 50 meters away from the nearest finding).

- Artifact Concentration 1: A low-moderate density scatter (#19-25) was documented in the northern portion of the APE. Sherds occurred within reasonably close proximity to each other.
- Artifact Concentration 2: Low-density scatters (#2-5, #13-14, #17-18, #36-37, #47-48) were documented in the western and southeastern portions of the APE.

Page 8

Although fewer in number than the previous concentrations, the sherds appeared within a spatially limited area that suggests a discrete concentration.

Isolated Finds: The remainder of the observations (31, #6-12, #15-16, #23, #26-35, #38-46, #49-51) were either single or widely dispered sherds, occurring without clear association to other materials.

No diagnostic or reconstructable ceramics were identified during the survey. The area surrounding each observation site is mostly undisturbed, with tire tracks marking the vicinity of most sites.

A map of findings is located in Appendix C, and photographs taken during the survey are located in Appendix D.

#### 7.0 RECOMMENDATIONS

Based on our review of previous environmental studies completed, and our pedestrian survey of the 789.00-acre site, no further action is recommended.

# Custom Soil Resource Report for Dona Ana County Area, New Mexico

789-acre expansion

# **Preface**

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (https://offices.sc.egov.usda.gov/locator/app?agency=nrcs) or your NRCS State Soil Scientist (http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2 053951).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require

alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). # **How Soil Surveys Are Made**

Soil surveys are made to provide information about the soils and miscellaneous areas in a specific area. They include a description of the soils and miscellaneous areas and their location on the landscape and tables that show soil properties and limitations affecting various uses. Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; the kinds of crops and native plants; and the kinds of bedrock. They observed and described many soil profiles. A soil profile is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed or from the surface down to bedrock. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

Currently, soils are mapped according to the boundaries of major land resource areas (MLRAs). MLRAs are geographically associated land resource units that share common characteristics related to physiography, geology, climate, water resources, soils, biological resources, and land uses (USDA, 2006). Soil survey areas typically consist of parts of one or more MLRA.

The soils and miscellaneous areas in a survey area occur in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, a soil scientist develops a concept, or model, of how they were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil

scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

The objective of soil mapping is not to delineate pure map unit components; the objective is to separate the landscape into landforms or landform segments that have similar use and management requirements. Each map unit is defined by a unique combination of soil components and/or miscellaneous areas in predictable proportions. Some components may be highly contrasting to the other components of the map unit. The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The delineation of such landforms and landform segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, onsite investigation is needed to define and locate the soils and miscellaneous areas.

Soil scientists make many field observations in the process of producing a soil map. The frequency of observation is dependent upon several factors, including scale of mapping, intensity of mapping, design of map units, complexity of the landscape, and experience of the soil scientist. Observations are made to test and refine the soil-landscape model and predictions and to verify the classification of the soils at specific locations. Once the soil-landscape model is refined, a significantly smaller number of measurements of individual soil properties are made and recorded. These measurements may include field measurements, such as those for color, depth to bedrock, and texture, and laboratory measurements, such as those for content of sand, silt, clay, salt, and other components. Properties of each soil typically vary from one point to another across the landscape.

Observations for map unit components are aggregated to develop ranges of characteristics for the components. The aggregated values are presented. Direct measurements do not exist for every property presented for every map unit component. Values for some properties are estimated from combinations of other properties.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists. For example, data on crop yields under defined levels of management are assembled from farm records and from field or plot experiments on the same kinds of soil.

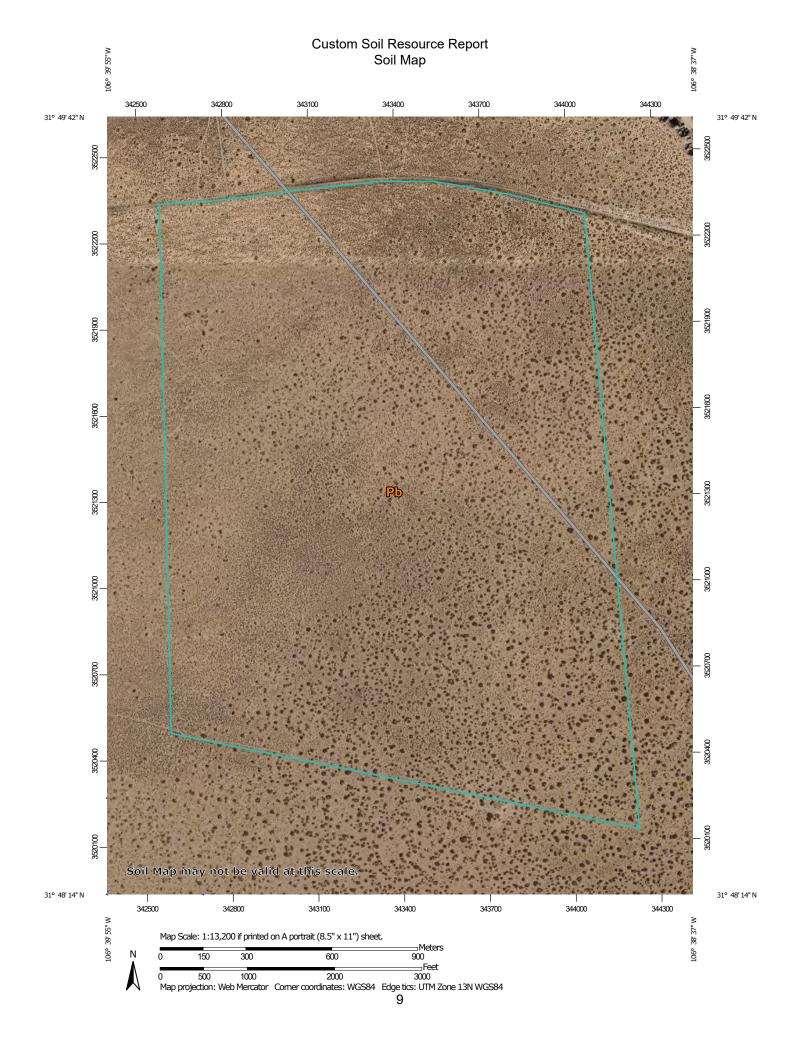

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and

identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

# Soil Map

The soil map section includes the soil map for the defined area of interest, a list of soil map units on the map and extent of each map unit, and cartographic symbols displayed on the map. Also presented are various metadata about data used to produce the map, and a description of each soil map unit.

#### MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24.000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service Web Soil Survey URL:

Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Dona Ana County Area, New Mexico Survey Area Data: Version 20, Sep 3, 2024

Soil map units are labeled (as space allows) for map scales 1:50.000 or larger.

Date(s) aerial images were photographed: May 3, 2017—Apr 4, 2021

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

## **Map Unit Descriptions**

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

#### **Dona Ana County Area, New Mexico**

#### Pb—Pajarito-Pintura complex

#### **Map Unit Setting**

National map unit symbol: p9bd Elevation: 2,700 to 5,000 feet

Mean annual precipitation: 5 to 14 inches

Mean annual air temperature: 58 to 62 degrees F

Frost-free period: 180 to 250 days

Farmland classification: Not prime farmland

#### **Map Unit Composition**

Pajarito and similar soils: 45 percent Pintura and similar soils: 35 percent Minor components: 20 percent

Estimates are based on observations, descriptions, and transects of the mapunit.

#### **Description of Pajarito**

#### Setting

Landform: Alluvial fans

Landform position (three-dimensional): Rise

Down-slope shape: Linear Across-slope shape: Convex

Parent material: Mixed coarse-loamy alluvium

#### Typical profile

H1 - 0 to 14 inches: loamy fine sand H2 - 14 to 28 inches: fine sandy loam H3 - 28 to 60 inches: loamy very fine sand

#### **Properties and qualities**

Slope: 0 to 3 percent

Depth to restrictive feature: More than 80 inches

Drainage class: Well drained Runoff class: Very low

Capacity of the most limiting layer to transmit water (Ksat): High (2.00 to 6.00

in/hr)

Depth to water table: More than 80 inches

Frequency of flooding: None Frequency of ponding: None

Calcium carbonate, maximum content: 5 percent

Maximum salinity: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)

Sodium adsorption ratio, maximum: 1.0

Available water supply, 0 to 60 inches: Moderate (about 6.5 inches)

#### Interpretive groups

Land capability classification (irrigated): 2e Land capability classification (nonirrigated): 7e

Hydrologic Soil Group: A

Ecological site: R042BB012NM - Sandy, Desert Shrub

Hydric soil rating: No

#### **Description of Pintura**

#### Setting

Landform: Shrub-coppice dunes on fan piedmonts Landform position (three-dimensional): Rise

Down-slope shape: Convex Across-slope shape: Convex

Parent material: Sandstone derived eolian sands

#### Typical profile

H1 - 0 to 10 inches: loamy fine sand H2 - 10 to 60 inches: fine sand

#### **Properties and qualities**

Slope: 0 to 5 percent

Depth to restrictive feature: More than 80 inches Drainage class: Somewhat excessively drained

Runoff class: Negligible

Capacity of the most limiting layer to transmit water (Ksat): High to very high (6.00

to 20.00 in/hr)

Depth to water table: More than 80 inches

Frequency of flooding: None Frequency of ponding: None

Maximum salinity: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)

Sodium adsorption ratio, maximum: 1.0

Available water supply, 0 to 60 inches: Low (about 4.2 inches)

#### Interpretive groups

Land capability classification (irrigated): None specified

Land capability classification (nonirrigated): 7e

Hydrologic Soil Group: A

Ecological site: R042BB011NM - Deep Sand, Desert Shrub

Hydric soil rating: No

Re: Cultural Resources Pedestrian Survey

Verde Site Development

Santa Teresa, Dona Ana County, New Mexico

Dear Mr. Vaughan:

We thank you for the opportunity to present the enclosed Cultural Resources Pedestrian Survey report for the above referenced project site. We were authorized to proceed with this study on February 12, 2025 by Mr. Harvey Powers, representing BorderPlex Digital Assets, LLC. The information we are presenting herein describes the procedures utilized for field investigation and database review, along with the results of our assessment. It also includes our evaluation of the data obtained and conclusions regarding potential archaeological artifacts.

It was a pleasure to work with you on this phase of your project, and we look forward to assist you further on this and other future projects. If you have any questions regarding the information we present herein, please call us.

Respectfully submitted,

LOI ENGINEERS

E. Isabel Olague

Environmental Scientist

#### **ABSTRACT**

LOI ENGINEERS (LOI) conducted a reconnaissance cultural resource pedestrian survey of a 400.00-acre tract of land located in Santa Teresa, Dona Ana County, New Mexico. The survey took place from February 17, 2025 through February 24, 2025. A cursory review of a cultural resource desktop assessment was also performed.

Scattered and isolated potential El Paso Brown ceramics were found concentrated in the east and south areas of the Area of Potential Effects (APE). Our findings were not curated nor collected. Past archaeological sites within the APE present similar findings, but collections were not considered eligible for inclusion in the National Register of Historic Places (NRHP).

APPENDIX D PHOTOGRAPHS

#### 1.0 INTRODUCTION AND PROJECT SUMMARY

BorderPlex Digital Assets, LLC contracted LOI Engineers (LOI) to conduct a cultural resource pedestrian survey of a site whose Area of Potential Effects (APE) totals  $\pm 400.00$  acres. The project area is located  $\pm 0.61$  miles east of Pete Domenici Boulevard and  $\pm 1.35$  miles north of Binational Way, in Santa Teresa, Dona Ana County, New Mexico.

The scope of this pedestrian survey includes a reconnaissance survey and a cursory review of a Cultural Resource Desktop Assessment Study conducted by a third-party firm (Terracon, 2024). As this project is 100% privately funded, there is no requirement for compliance with Section 106 of the National Historic Preservation Act (NHPA) of 1996, as well as no coordination with the New Mexico Historic Preservation Division, which serves as the State Historic Preservation Office (SHPO).

#### 2.0 PROJECT INFORMATION

This survey is:	☐ the initial survey for this project.
	☑ a continuation of previous survey(s):
	Previous investigation(s): Terracon, 2024.
Report Completion Date:	03/07/2025
Date(s) of Survey:	02/17/2025 to 02/24/2025
Archeological Survey Type:	□ Reconnaissance □ Intensive
Report Version:	☐ Draft ⊠ Final
Report Author(s) and Affiliation:	E. Isabel Olague, Cleo Cisneros, and John D. Cordova, P.E., of LOI Engineers.
Estimated Percentage of Time that the Principal Investigator was in the Field:	25%

#### 3.0 AREA OF POTENTIAL EFFECTS AND SURVEY AREA

#### Area of Potential Effects (APE):

The APE encompasses the entirety of the project are, which is approximately 400.00 acres of land in Santa Teresa, Dona Ana County, New Mexico. Prior archeological investigations have taken place in select areas of the APE. The APE encompasses the entirety of the project area, regardless of the extent of prior archeological investigations, the particular locations subject to field investigations, or the portion of a project added through a design change. If impacts are not known, worst-case impacts are assumed in defining the APE.

See Appendix A for a map of the APE.

#### No Survey Area:

Not applicable – the entire APE requires survey.

#### **Access Denied Area:**

There was no area requiring survey to which access was denied for this project.

#### Survey Area:

The survey area is the same as the APE.

#### 4.0 PROJECT SETTING

#### **Natural Setting:**

#### Topography:

There are no significant landforms at the project site. Uneven terrain encompasses the entirety of the site, with small sand dunes and arroyos of different sizes cutting across the site. There are clearings devoid of plant life that may have attracted past human activity due to the undisturbed space and surrounding sand dunes potentially serving as protective features. No areas of actively flowing water were observed during the survey.

#### - Geology:

According to the New Mexico Bureau of Mines and Mineral Resources geologic map (located in Appendix B-1.1), provided by United States Geological Survey (USGS), the APE is located in a Qcf, geologic zone (Seager et al., 1987). Part of the Rio Grande Rift, this zone is characterized by fluvial facies, most notably deposits from the Rio Grande, historically. This includes gray to yellow sand, pebble to cobble gravel, calcite-cemented sandstone and conglomerate, and gray, green, or red loam to clay with minor volcanicash lenses (Seager et al., 1987). There were no areas that geologically indicated past human activity at the surface or below the surface.

#### - Soils:

The U.S. Department of Agriculture's National Resource Conservation Service Web Soil Survey (WSS, 2025) was utilized to classify the soils within the APE, located in Appendix B-1.2. The soils are classified in the Pajarito-Pintura complex, with a 45-35 percent composition, respectively. The remaining 20 percent consists of minor components.

The parent material that makes up the Pajarito component is mixed coarse-loamy alluvium. It has very low runoff potential and drains water well. The soil is not considered a hydric soil.

The parent material that makes up the Pintura component is sandstone derived eolian sands. The runoff class is negligible and water is somewhat excessively drained. The soil is not considered a hydric soil.

The remaining soil components are Onite, Simona, Harrisburg, and Wink. All four profiles are not considered to be hydric soils.

This soil complex would not have allowed for significant pooling of water or provided a significant source of water.

#### Historic Land Use:

According to aerial photographs, the land has historically been used as undeveloped and vacant land. The land has not been used in a significant way. A historic abandoned railroad lies to the north of the APE, but it is currently an unpaved road.

#### Land Use:

The land is currently vacant and undeveloped, and is not in use. There is a semi-graded area of land at the northeast corner that cuts diagonally from the north side to the east side of the site. This strip of land is about 20 feet across and seems to be used as a path. The west side of the path is lined with partially intact barb-wired fencing with wood posts. There is no evidence of any other disturbance by previous construction, development, or other modern land use practices.

#### Vegetation:

Various species of desert shrubs, trees, and grasses were identified throughout the project site during the pedestrian survey, including creosote brush, tobosa grass, and soaptree yucca.

#### **Previous Cultural History:**

According to the Cultural Resource Desktop Survey (Terracon, 2024), the New Mexico Cultural Resources Information System (NMCRIS) has identified five previous archaeological sites within the APE. These sites are LA129785, LA130170, LA163148, LA163152, and LA204990. Three of these sites are not considered eligible or have an undetermined status (LA129785, LA163148, and LA163152). LA130170 represents the historical abandoned railroad that lies to the north of the APE, and LA204990 is in the process of entering data. No known cemetaries are located at or within one mile of the APE.

#### **Evaluation of Project Setting:**

Based on the undisturbed nature of the project setting, there is a likelihood of prehistoric or historic archaeological sites being present. If the area were to be left undisturbed,

Page 6

natural weather events may not be able to preserve such findings with sufficient integrity.

#### 5.0 SURVEY METHODS

#### Surveyors:

E. Isabel Olague, Cleo Cisneros, and John D. Cordova, P.E. of LOI Engineers surveyed the APE.

#### **Description of Methods:**

A pedestrian inspection reconnaisance was conducted for the purposes of this survey. The APE was divided into 100 grids. Each grid was walked in five transects from west to east, or east to west, moving from north to south. If any visible artifacts were found while observing the ground and landscape, each location was staked, the coordinates were recorded using a Global Positioning System (GPS), and photos were taken of the artifact(s) found. No excavations were performed, nor shovel test pits or augers, or any other mechanical equipment used.

#### Other Methods:

None.

Collection and Curation: 

☑ NO 
☐ YES

No collection was conducted during the pedestrian survey.

#### **Comments on Methods:**

A reconnaisance survey was conducted to determine the archaeological potential of the APE. No collection of any findings was conducted unless a substantial artifact was found.

#### 6.0 SURVEY RESULTS

#### Survey Area Description:

The survey area is composed primarily of loamy sand and various desert shrubs. There is no evidence of past or current land grading, and no improvements have been made at the project site, except for a dirt path that transects the survey area at the northeast corner. Various animal tracks were observed, as well as jackrabbits, birds, and a burrowing owl. Tire tracks presumably belonging to recreational sports vehicles were also acknowledged during the survey. Modern human artifacts were identified, including articles of clothing, backpacks, plastic and glass bottles, bullet casings, and other miscellaneous items.

Reliable sources of water were not immediately observed within or around the APE. While many geological substances were identified, no sources of toolstone were observed during the reconnaissance. The APE is considered not to contain arable land due to the extreme lack of rainfall – water would need to be supplied through extensive irrigation systems.

Because of observations made during the survey, cultural artifacts found would not be preserved with good integrity. Modern human activity would likely compromise, and have compromised, the integrity of any sites (through the use of recreational vehicles and passage of humans). These areas would need to be restricted to the public and protective measures would need to be put in place, only if anything found were to be considered eligible for the National Register of Historic Places (NRHP), so that disturbances would be minimized.

#### Archaeological Materials Identified and Archaeological Site Description:

Potential cultural artifacts identified during the survey were concentrated along the eastern and southern areas of the APE.

Archaeological site LA130170 was identified at the north border of the site, exhibiting the raised land from the abandonded railroad bed currently serving as an unpaved road.

Because information is not yet available for site LA204990, it was undetermined whether this archaeological site's findings were encountered.

Clusters of varying quantity of what are potential El Paso Brown ceramics were identified in five areas within a 125-foot radius, and in three areas within a 75-foot radius. Isolated findings were located in the same general area, but were over 125 feet from the nearest find. The ceramic shards were found in areas that have not had any known previous archaeological investigations performed. Scattered lithic materials were also found.

The individual pieces resembled El Paso Brown ceramic findings, but were not sufficient in quantity to determine the complete shape of any potential piece of ceramic pottery. It is also known that during past archaeological surveys, ceramics had been collected within the APE, and were determined to be not eligible. The area surrounding each observation site is mostly undisturbed, with tire tracks marking the vicinity of most sites.

The ceramics were located in areas slightly lower in elevation than surrounding landforms (dunes), and mostly in areas not immediately adjacent to plant life.

A map of findings is located in Appendix C, and photographs taken during the survey are located in Appendix D.

#### 7.0 RECOMMENDATIONS

Based on our review of previous environmental studies completed, and our pedestrian survey of the 400.00-acre site, no further action is recommended. Past achaeological sites within the APE presented similar findings, but collections were not considered eligible for inclusion in the National Register of Historic Places (NRHP).

# Custom Soil Resource Report for Dona Ana County Area, New Mexico

**Verde Site Development** 

#### **Preface**

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (https://offices.sc.egov.usda.gov/locator/app?agency=nrcs) or your NRCS State Soil Scientist (http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2 053951).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. ### **How Soil Surveys Are Made**

Soil surveys are made to provide information about the soils and miscellaneous areas in a specific area. They include a description of the soils and miscellaneous areas and their location on the landscape and tables that show soil properties and limitations affecting various uses. Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; the kinds of crops and native plants; and the kinds of bedrock. They observed and described many soil profiles. A soil profile is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed or from the surface down to bedrock. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

Currently, soils are mapped according to the boundaries of major land resource areas (MLRAs). MLRAs are geographically associated land resource units that share common characteristics related to physiography, geology, climate, water resources, soils, biological resources, and land uses (USDA, 2006). Soil survey areas typically consist of parts of one or more MLRA.

The soils and miscellaneous areas in a survey area occur in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, a soil scientist develops a concept, or model, of how they were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil

#### Custom Soil Resource Report

scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

The objective of soil mapping is not to delineate pure map unit components; the objective is to separate the landscape into landforms or landform segments that have similar use and management requirements. Each map unit is defined by a unique combination of soil components and/or miscellaneous areas in predictable proportions. Some components may be highly contrasting to the other components of the map unit. The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The delineation of such landforms and landform segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, onsite investigation is needed to define and locate the soils and miscellaneous areas.

Soil scientists make many field observations in the process of producing a soil map. The frequency of observation is dependent upon several factors, including scale of mapping, intensity of mapping, design of map units, complexity of the landscape, and experience of the soil scientist. Observations are made to test and refine the soil-landscape model and predictions and to verify the classification of the soils at specific locations. Once the soil-landscape model is refined, a significantly smaller number of measurements of individual soil properties are made and recorded. These measurements may include field measurements, such as those for color, depth to bedrock, and texture, and laboratory measurements, such as those for content of sand, silt, clay, salt, and other components. Properties of each soil typically vary from one point to another across the landscape.

Observations for map unit components are aggregated to develop ranges of characteristics for the components. The aggregated values are presented. Direct measurements do not exist for every property presented for every map unit component. Values for some properties are estimated from combinations of other properties.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists. For example, data on crop yields under defined levels of management are assembled from farm records and from field or plot experiments on the same kinds of soil.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and

#### Custom Soil Resource Report

identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

## Soil Map

The soil map section includes the soil map for the defined area of interest, a list of soil map units on the map and extent of each map unit, and cartographic symbols displayed on the map. Also presented are various metadata about data used to produce the map, and a description of each soil map unit.

#### MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24.000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service Web Soil Survey URL:

Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Dona Ana County Area, New Mexico Survey Area Data: Version 20, Sep 3, 2024

Soil map units are labeled (as space allows) for map scales 1:50.000 or larger.

Date(s) aerial images were photographed: May 3, 2017—Apr 4, 2021

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

#### **Map Unit Descriptions**

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

#### Custom Soil Resource Report

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An association is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

Re: Authorization for STACK and BorderPlex Digital to Act on Behalf of Santa Teresa Land, LLC

Dear Mr. Guerra,

Santa Teresa Land, LLC hereby authorizes STACK Infrastructure, Inc. ("STACK") and BorderPlex Digital Assets, LLC ("BorderPlex Digital") to act on its behalf in connection with applications to the New Mexico Department of Transportation ("NMDOT") for site access points to state highway(s) and other matters related to the development of all or parts of parcels 4013168307484, 4013169297270, 4014168260459, 4014169264264, 4015168219490, 4015169264264, and 4011168264264.

Exhibit A ("Boundary Survey 702.28 Acres"), Exhibit B ("Boundary Survey 412.694 Acres"), Exhibit C ("Boundary Survey 285.03 Acres"), and Exhibit D ("Boundary Survey 121.16 Acres") illustrate the areas whereon development is planned.

This authorization includes, but is not limited to, the preparation, submission, and processing of all necessary permit applications and related documentation.

We respectfully request that NMDOT recognize STACK and BorderPlex Digital as our authorized representative for the purposes described above.

Please direct any related correspondence to:
